Piling work with zero clearance to adjacent structures

# Zero Clearance Method

## Introduction

The Zero Clearance Method employs an especially designed press-in machine and Zero Sheet piles (NS-SP-J) to press-in piles with zero "dead space" between the piles and the adjacent structure. Conventional approaches often fail to provide a solution in civil engineering works on narrow water courses, etc., or building projects requiring efficient utilization of the available land. But the Zero Clearance Method enables maximum use of the space in a way that was not possible before.

Also, the machinery is compact, so it doesn't dominate the surrounding area, has no risk of overturning, and is very safe indeed. And by using the GRB System, which requires no temporary works, the construction time is shortened and costs are reduced. This path-breaking method is hugely beneficial in the development of underground spaces and antiseismic reinforcement work.

### **Overview of Zero Clearance Method**

The press-in machine and piles are custom-designed to achieve zero clearance when working up against an existing structure, so efficient use can be made of limited work space

The Zero Clearance Method uses especially designed equipment and Zero Sheet Piles (NS-SP-J) to insert piles with zero "dead space" between the piles and the adjacent structure.

### The Superiorities of the Press-in Method

- No Vibration / No Noise
- No Overturning
- Press-in Machine Light and Compact
- Pile Bearing Capacity can be **Checked as Work Progresses**
- High Working Precision

SILENT PILER<sup>™</sup> JZ100B

### Features of the Zero Sheet Pile (NS-SP-J)

- Interlock joint on the outside means no need to reduce cross-sectional performance because of interlock efficiency
- Individual piles are very rigid and resistant to deformation, making them excellent to work with

## **Zero Clearance Method**

### Features of the Zero Clearance Method

#### $\bigcirc$ Respectful of the surrounding area

Because the Press-in Method uses static load, and the Zero Sheet Piles (NS-SP-J) all face the same way, then it is possible to minimize the effects on the ground behind the piles when using driving assistance.

#### Excellent Safety with No Risk of Overturning

Because the press-in machine grips securely onto the completed piles, there is no risk of overturning.

#### Outstandingly Economical

The Zero Sheet Piles (NS-SP-J) have their interlock situated on the outside, which enables economical design with no need to lower cross-sectional peformance on the grounds of interlock efficiency.

#### Faster Completion

The Zero Sheet Piles (NS-SP-J) have an effective width of 600 mm, and when compared with 400 mm-width sheet piles, this means fewer piles to install and shorter construction time.

Construction works can be carried out with Environmentally-friendly considerations, lower cost and shorter work duration at any work conditions.

### **GRB** System

## **GRB System for "Temporary Work Less" Construction**

The GRB System applies the Press-in Principle which states that a reaction force is obtained from completed piles. In this way, all of the steps of the process, from transporting and pitching the pile, to pressing it in, can be carried out from a position on top of the existing piles. And since all of the equipment is self-supporting and grips onto the completed piles, then there is no risk of overturning, and the area affected by the works is restricted to the width of the machinery on the piles. Even over water, on sloping or uneven ground, in narrow spaces, or locations with restricted headroom, the GRB System has no need for any temporary structures, like platforms or roadways, and can focus efficiently on the purpose of the project - building the main structure.

#### **Standard Machine Layout**

#### **GRB System Working Layout**

#### PILE RUNNER™

### **Applications & Reference**

## Mater Course Repair Work

The SILENT PILER can install piles with zero dead space to adjacent structures, and provided that there is at least a space corresponding the pile wall thickness (200 mm) between the existing water course and the adjoining boundary, the equipment is capable of working safely without interrupting ongoing activites and functions, even in narrow sites where conventional methods are not applicable.

River Restoration Project to Repair Earthquake Damage, Soeyamafurukawa Hokkaido

An extremely safe construction process, minimizing the gap to the houses and making efficient use of the available ground.

## Existing Telegraph Pole (Joint Use) House SILENT PILER™ , G.I Planned Height of **River Bottom** Scour Depth

## A Trackside Projects

Piles could be built close alongside the tracks during train operating hours, without any effect on traffic, resulting in much faster completion.

The SILENT PILER is capable of working safely in strict observance of building restrictions, and respects the train safety gauge at all times. The machinery does not have to be assembled and removed every day, there is no impact on railway operations, and the construction time can be made much shorter.

No. 1 Shimounabara B Reconstruction Project between Nonai and Yadamae on the Tohoku Main Line Aomori Prefecture

### **Applications & Reference**

The compact SILENT PILER and the special piles used minimize the effects on the surrounding area and make it possible to construct retaining walls for roads alongside residential dwellings.

> Adjacent Structure

→ +15.55 RWL +15.00

#### Specific Country Road Repair Works, Road Improvements on Urban Stretch between Shimbashi and Mure Yamaguchi Prefecture

Retaining wall built with minimum clearance between sheet piles and adjacent structure. Safe and compact machinery means that work is completed without having to demolish nearby structures.

#### i i Г 7 | | | Ј 「 7 | | | 」

Zero Clearance Method

#### New Construction, Mitsui Life Matsue Building

Achieving zero clearance to the adjacent structure makes more land available for building Project completed with no effects on the surrounding area.

## **Architectural Bracing Projects**

The Zero Clearance Method is compact and safe, and permits highly efficient work in sites with very restricted lateral space. Using the Zero Sheet Piles helps to minimize the thickness of the retaining wall, so that the available building land can be used to the maximum.

### **Eco-Friendly Design**

#### Exhaust Gas Cleaning Compliant with "Offroad" Law

The SCZ-ECO600S Power Unit is equipped with a new-generation environmentally friendly engine. The high combustion efficiency, allied with GIKEN independent hydraulic control technology, means that exhaust gases are cleaned thoroughly and effectively, and the equipment complies with the "Off-Road" Law regulating work vehicle emissions and Level 3 of the Ministry of Land, Infrastructure, Transport and Tourism's exhaust gas measures for construction machinery.

### **Meeting Ultra-Low-Noise Standards**

The Power Unit also meets the "ultra-low-noise standards" set by the MLIT.

### **Biodegradable Oils for Standard Specification**

The press-in machinery uses special biodegradable hydraulic oil (PILER ECO OIL) and grease (PILER ECO Grease) developed by GIKEN in collaboration with oil manufacturers. In the event of any escape into the water or soil, the oil and grease is decomposed by natural bacteria and has no effect on the ecosystem.

#### Their biodegradability has been certified by biodegradability test.

Activated sludge was used as microorganism source. Biochemical oxygen consumption (BOD) of specimen material (PILER ECO OIL & PILER ECO Grease 100mg/L) was continuously assayed by automatic assay system to valuate biodegradability (percentageofvolumeofdegradeintocarbon dioxide and water) after 28 days.

#### After 28 days (Required more than 60% degraded.)

Eventually 100% will degraded. Time differs from conditions for 100% degrade.

#### Avirulence is certified by Fish Toxicity Test.

After 4 days (Survival rate needs to be more than 50%)

### THE FIVE CONSTRUCTION PRINCIPLES

"The Five Construction Principles" are the universal criteria for the construction method selection and construction quality, by considering ideal situations for construction work under public perspective.

In any construction project, the five aspects i.e. Environmental Protection, Safety, Speed, Economy and Aesthetics, should be fulfilled in the form of equilateral pentagon.

Environmental Protection	Construction work should be environmentally friendly and free from pollution.
Safety	Construction work has to be carried out in safety and comfort with a method implementing the highest safety criteria.
Speed	Construction work should be completed in the shortest possible period of time.
Economy	Construction work must be done rationally with an inventive mind to overcome all constraints at the lowest cost.
Aesthetics	Construction work must proceed smoothly and the finished product should portray cultural and artistic flavour.
